Server-Side & Client Side

What it means to develop with a SS language

Basic Web Surfing

Where's your surf board?

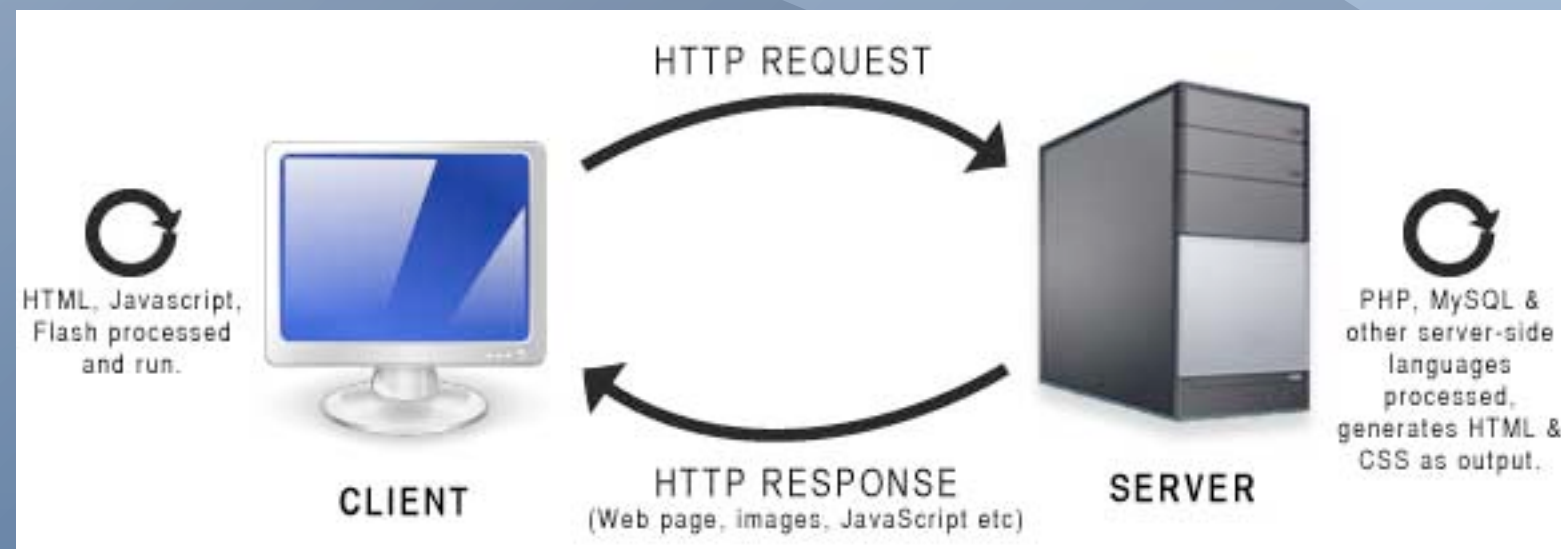

Server Side

How it works

○ How it works:

- Client asks for page from server (request)
- Server processes code (interprets)
- Server sends code back to client (response)
- Client processes code for user (interprets)

Server Computer

You can setup a web server in your own home.

Server Computers

Server rack setup

Client Side

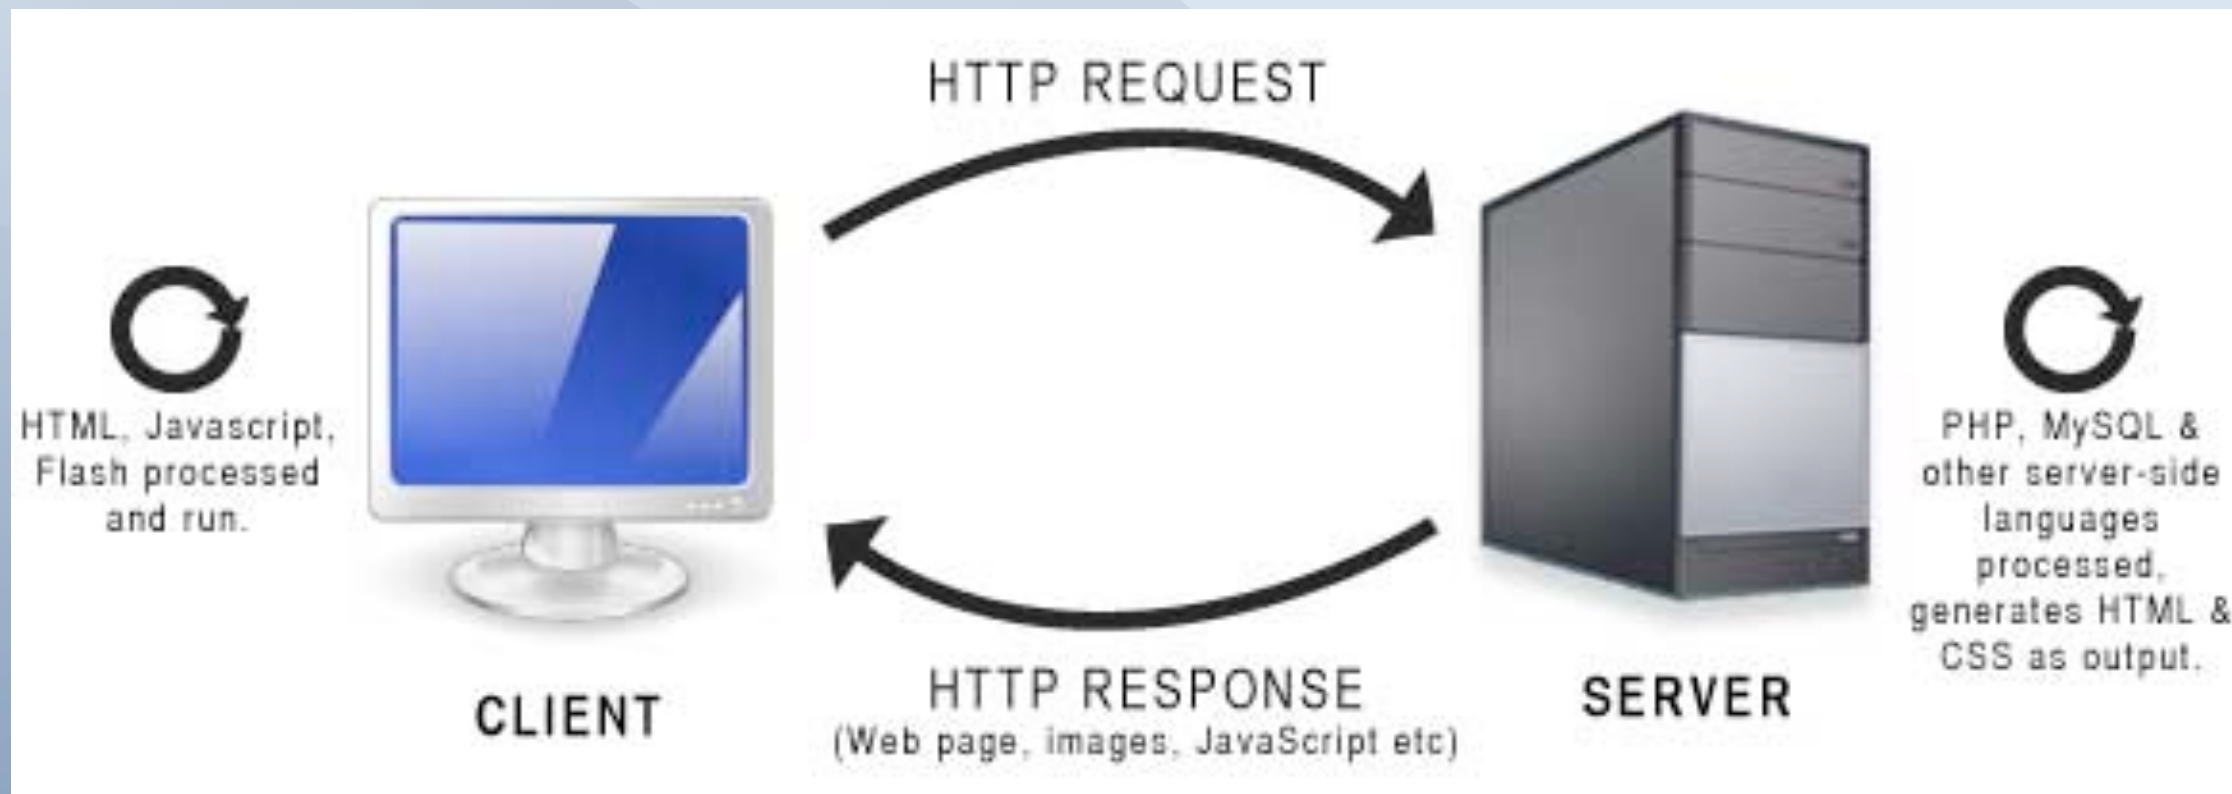

Where's your surf board?

You don't "surf"
the web... the web
flows to you...

Server Side

How it works

Client Side

What your web browser processes...

- Client Side technologies:
 - HTML/XHTML, CSS, JavaScript, Flash, ActionScript, Dart
- Interpreted by the browser (some exceptions like Flash and AS3)
- Essential for interactivity

Server Side

What a server processes...

- ◎ Server Side technologies:
 - PHP, Python, Ruby, Perl, Java, ASP/ASP.net
 - interpreted by the server
- ◎ Works with client-side technologies

Server vs. Client Side

Fight!!

- Security with Server Side
 - Visible Code vs Invisible Code
 - Server gets code together and sends it off. So base code is invisible to client.
- Client-side Processing vs Server Side processing
